

XTERIOHUB MASTER WEBSITE PROMPT (Concise Edition)

1. Vision & Design System

Build XTERIOHUB as a world-class architectural experience using React + Vite, Tailwind CSS, Framer Motion, GSAP and Lenis. The website must feel like Apple, Porsche and leading architecture firms—not a construction catalogue. Use an elegant white architectural theme with premium typography, large photography, editorial layouts, generous whitespace and subtle blue accents. Every interaction should feel handcrafted.

2. Homepage

Begin with a 3-second brand reveal featuring the centered XTERIOHUB logo, ambient glow and seamless zoom into the homepage. Show only the hero image first, then reveal the navbar, heading, subtitle and CTA sequentially. Use four hero images from assets/hero changing every 5 seconds with cinematic cross-fades. The homepage tells the story of XTERIOHUB: Who We Are, Engineering Philosophy, Experience, Statistics, Why Choose XTERIOHUB, Featured Projects, Technology, AI Studio Preview and a final call to action. Use large architectural photography and avoid repetitive cards.

3. Brand Pages

Create separate navigation pages for Frontek, Techlam, Tempio and Steni. Each page includes Hero, About, Product Range/Collections, Projects, Downloads and Contact. Frontek additionally includes Plus System and Super Plus System. Collections are presented as a premium 3D Material Library where users select a category and then a collection. Each collection opens a fullscreen Material Explorer with rotating 3D panel, dimensions, finishes, applications, downloadable documents and request sample. Automatically organize collections by official names.

4. Projects & AI Studio

Projects are displayed in a premium masonry gallery with large photography. Hovering creates a soft bloom effect while the project name, location and material elegantly appear. Clicking opens a dedicated project page with image gallery and technical information. AI Studio allows users to upload a building, choose a brand, choose a collection and preview the façade before requesting a quotation.

5. Motion & Development Rules

Use GSAP and Framer Motion for all animations. Hero images cross-fade every five seconds with subtle Ken Burns movement. Navigation becomes glass on scroll. Buttons are magnetic with refined hover effects. Maintain 70% photography and 30% text. Avoid generic templates, fake testimonials, repeated card grids and excessive overlays. Optimize for responsiveness, accessibility, SEO and performance. Build reusable React components and keep each brand independent while maintaining a consistent design system throughout the website.
